

ShareYourCloning: an Open Source web application for cloning in the DBTL world

Manuel Lera-Ramirez¹, Jürg Bähler¹

1. University College London, Institute of Healthy Ageing and Department of Genetics, Evolution & Environment, London, U.K.

The problem

We can describe sequence features in open formats (such as **.gb**), but not cloning strategies.

Let's imagine a typical strategy to clone a gene into a plasmid through Gibson assembly:

There must be an Open Standard to represent this, since it is routinely done in **hundreds of laboratories**.

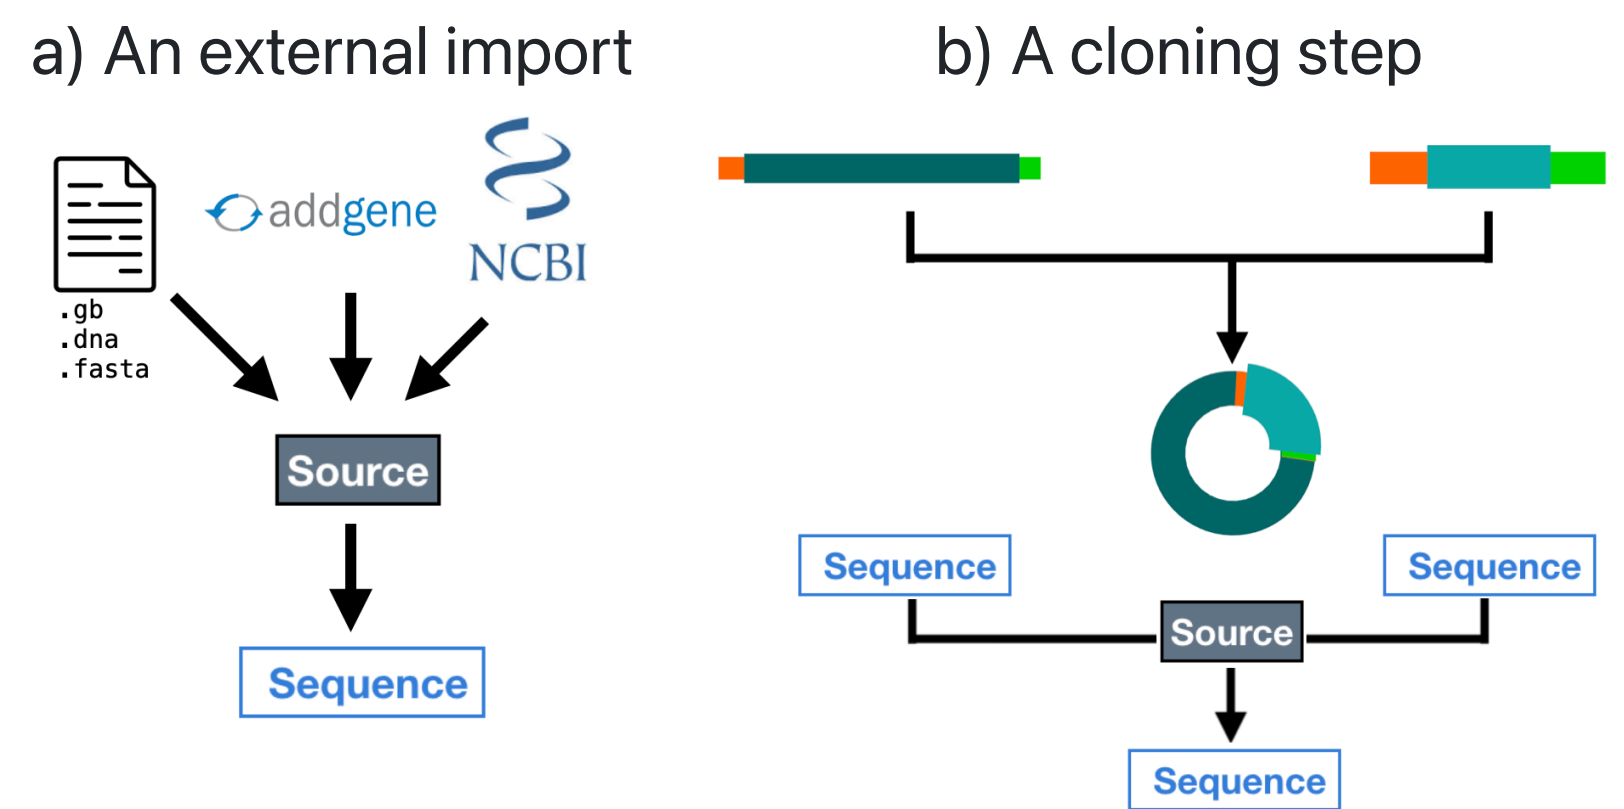

No standards means no way to automate tasks or design tools

The solution

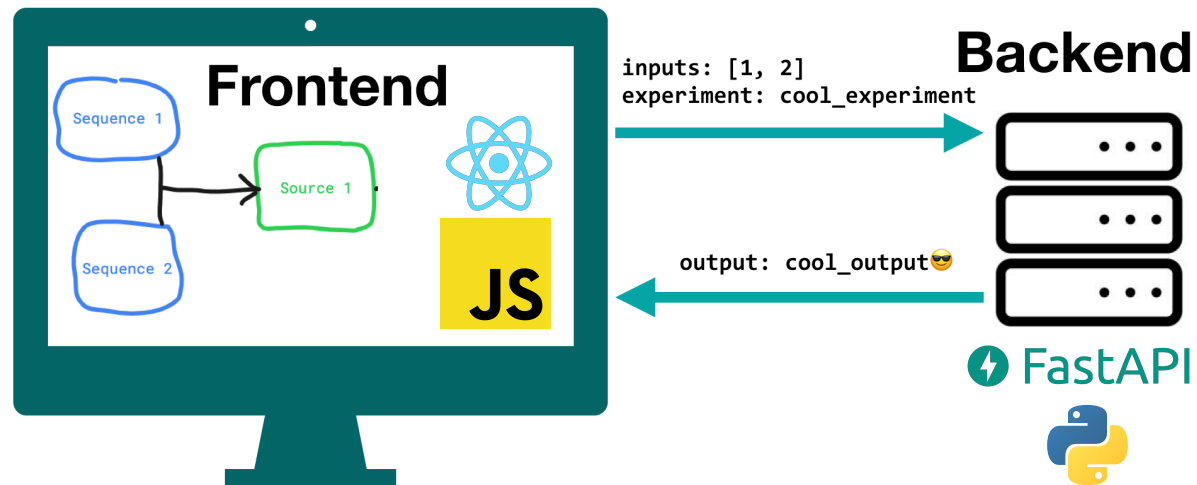

A data model to represent cloning strategies

Every **Sequence** comes from a **Source** representing:

An amazing Open Source web application

Enter **ShareYourCloning**, a web application where you can simulate your cloning strategy and export it in this format to share with others or for publication.

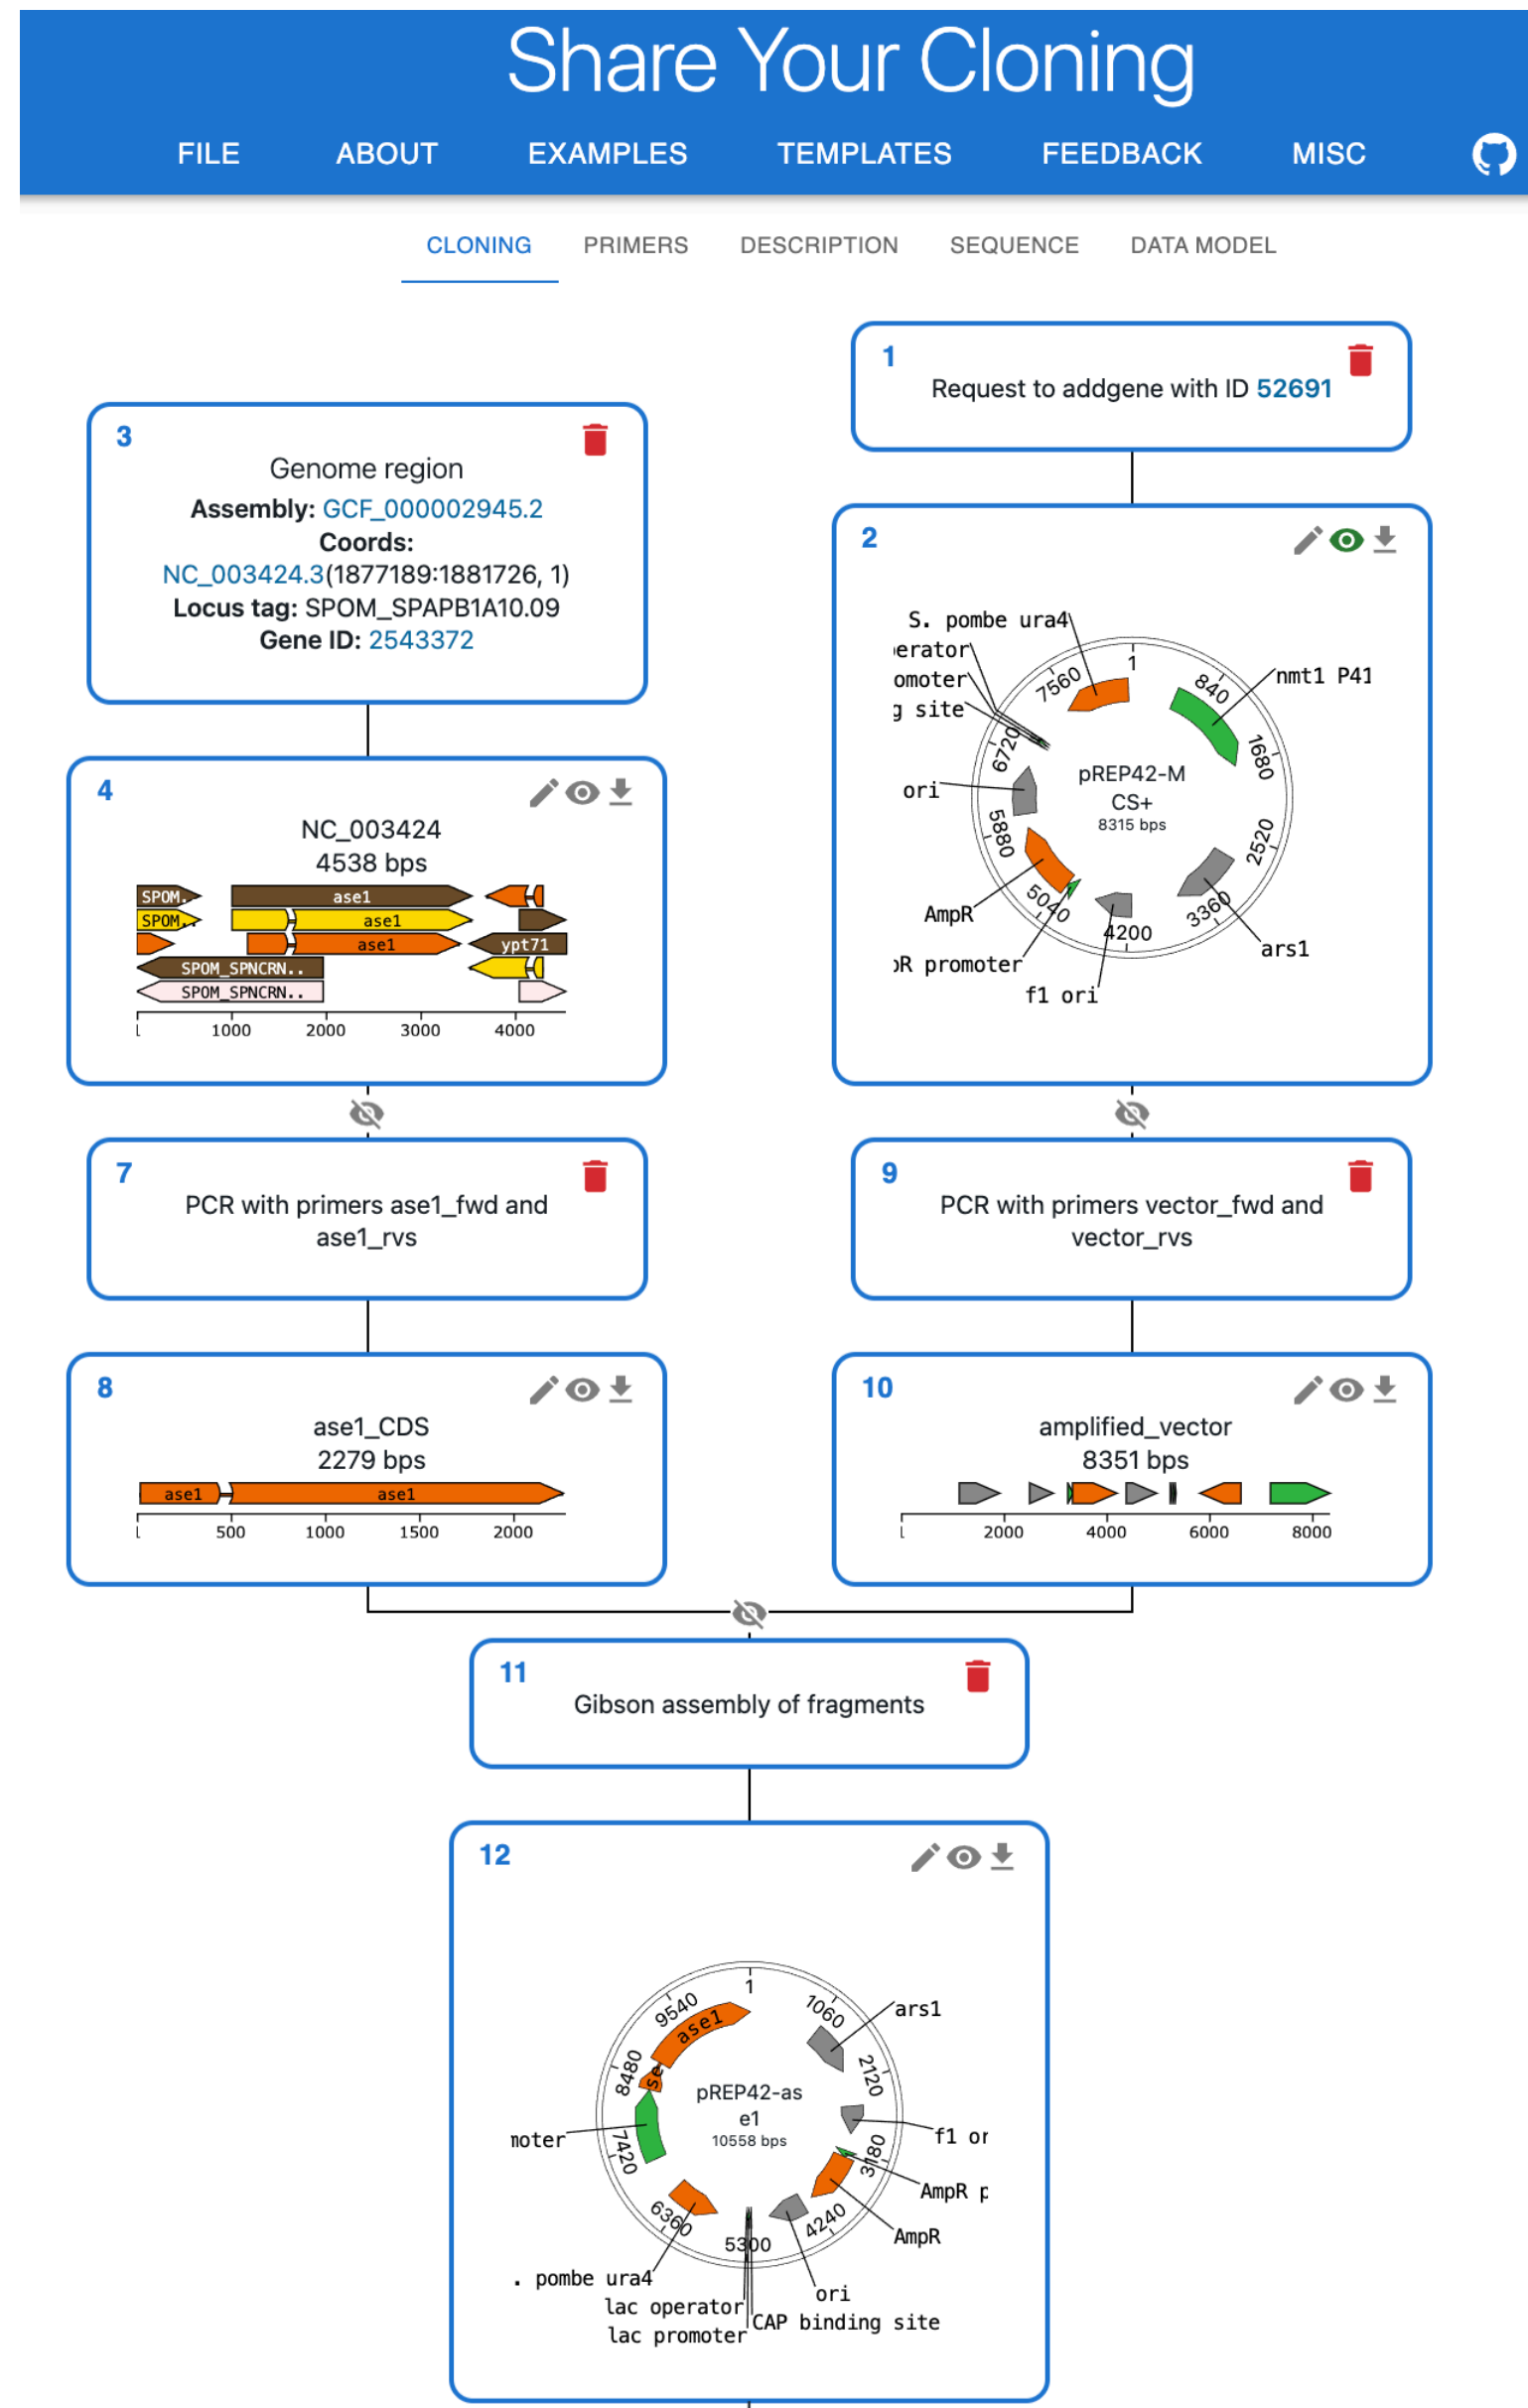

Extending and maintaining cloning libraries

As part of the project I maintain, use and extend **pydna**, a BioPython-based library to simulate cloning.

If you are into scripting and want to automate your cloning, you might want to try it.

```
> pip install pydna
```

Try it yourself!

Web application GitHub repository

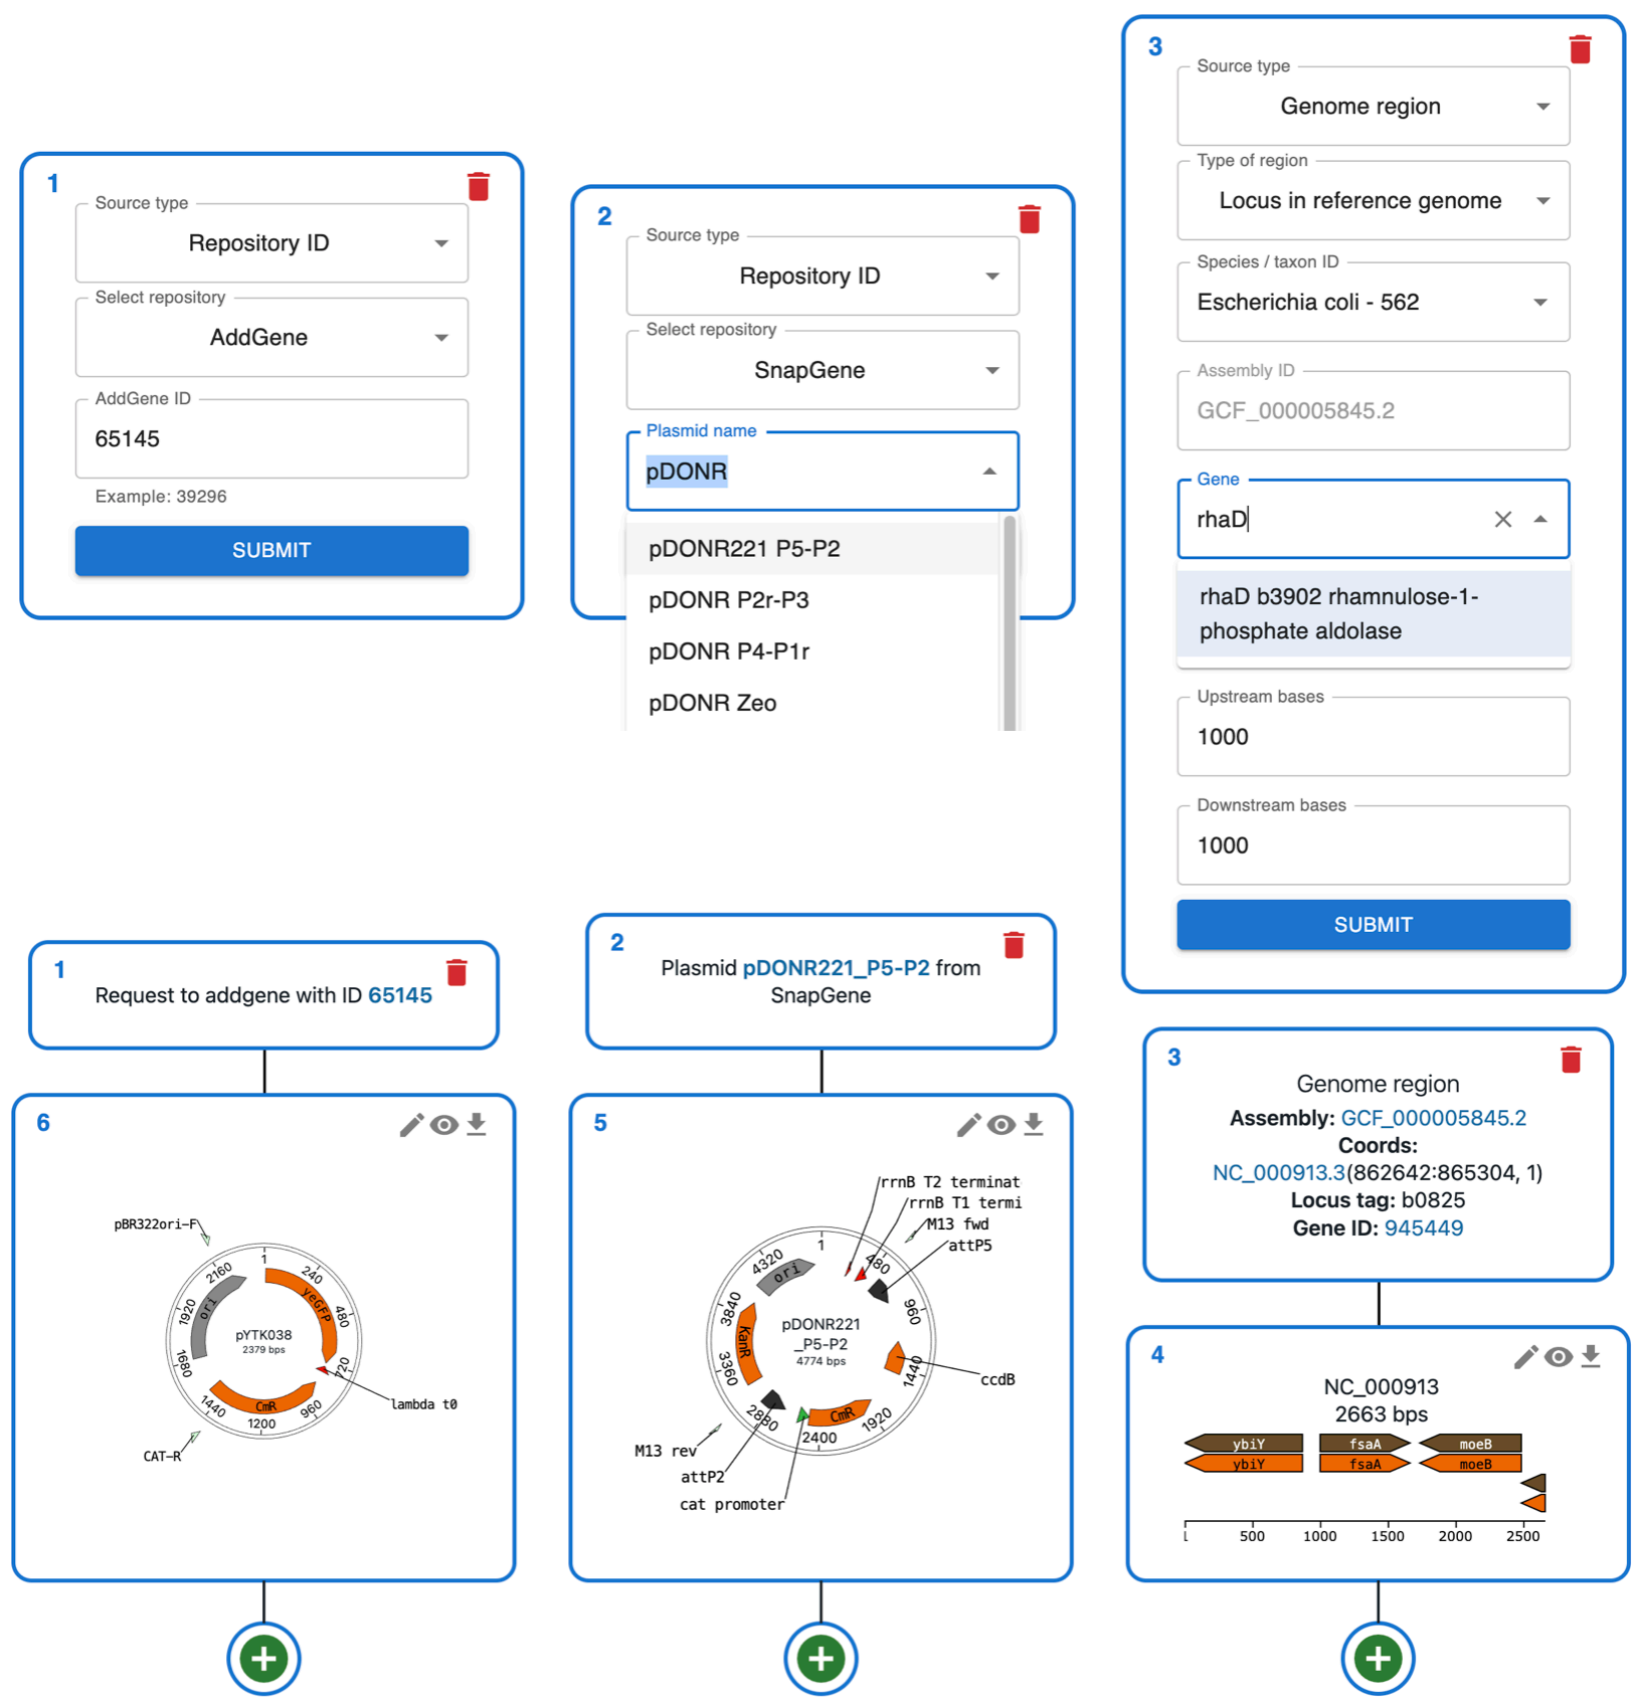

<https://shareyourcloning.org/>

Features

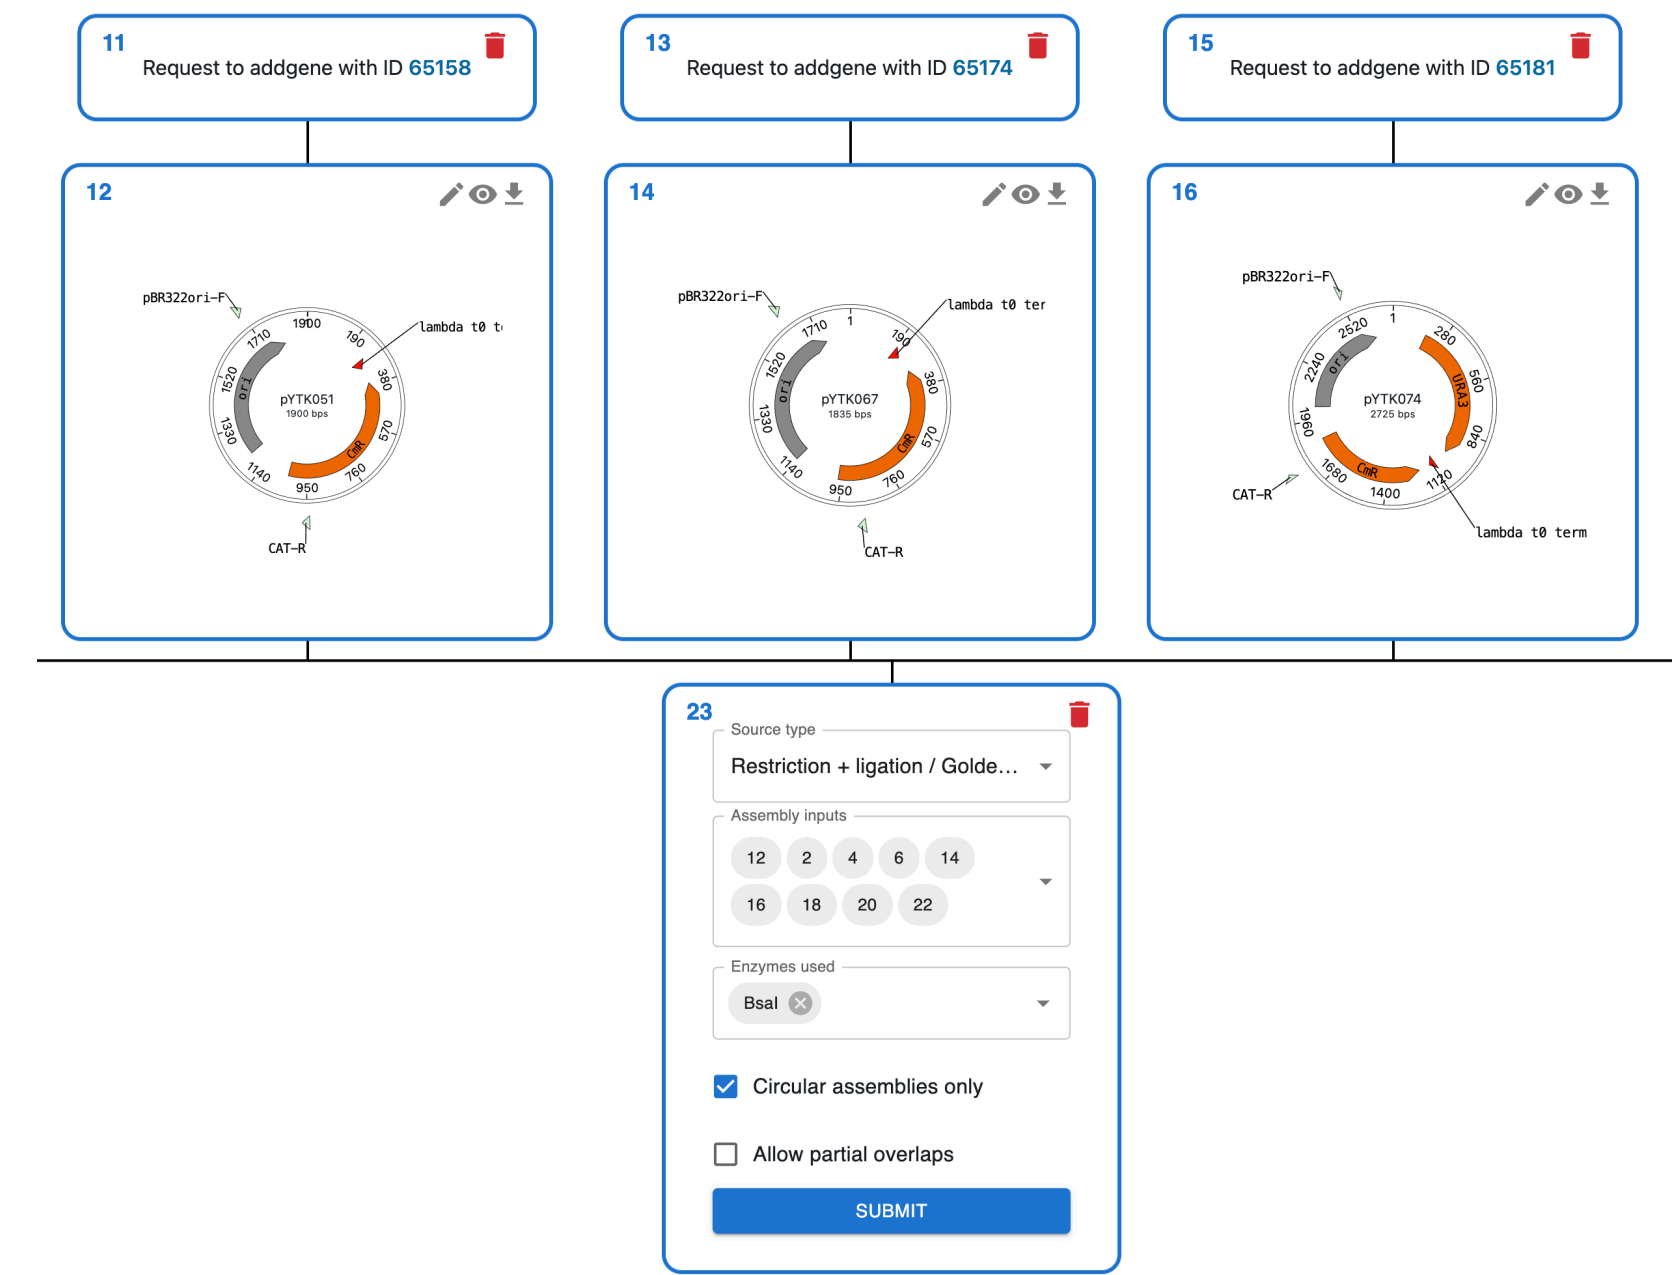

Import from anywhere

- Local files
- AddGene
- GenBank
- NCBI genomes (by gene or region)
- SnapGene website
- Benchling link
- EuroScarf

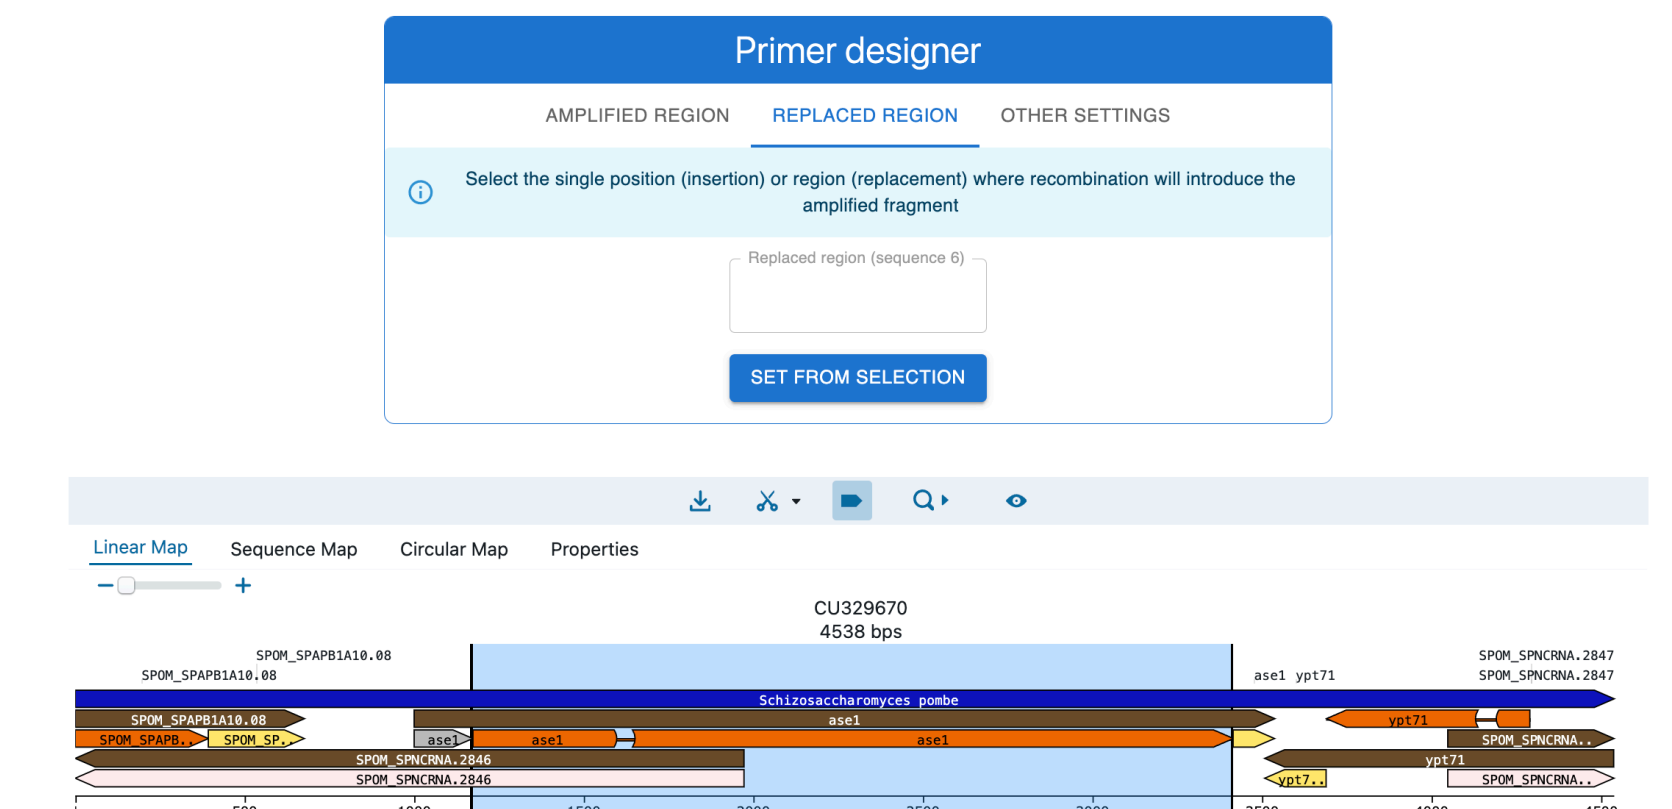

Techniques supported

- Golden Gate
- Gibson Assembly
- Restriction - ligation
- PCR
- Hom. Recombination
- CRISPR-HDR
- Overlap extension PCR
- Gateway™
- Polymerase extension
- Oligo hybridization

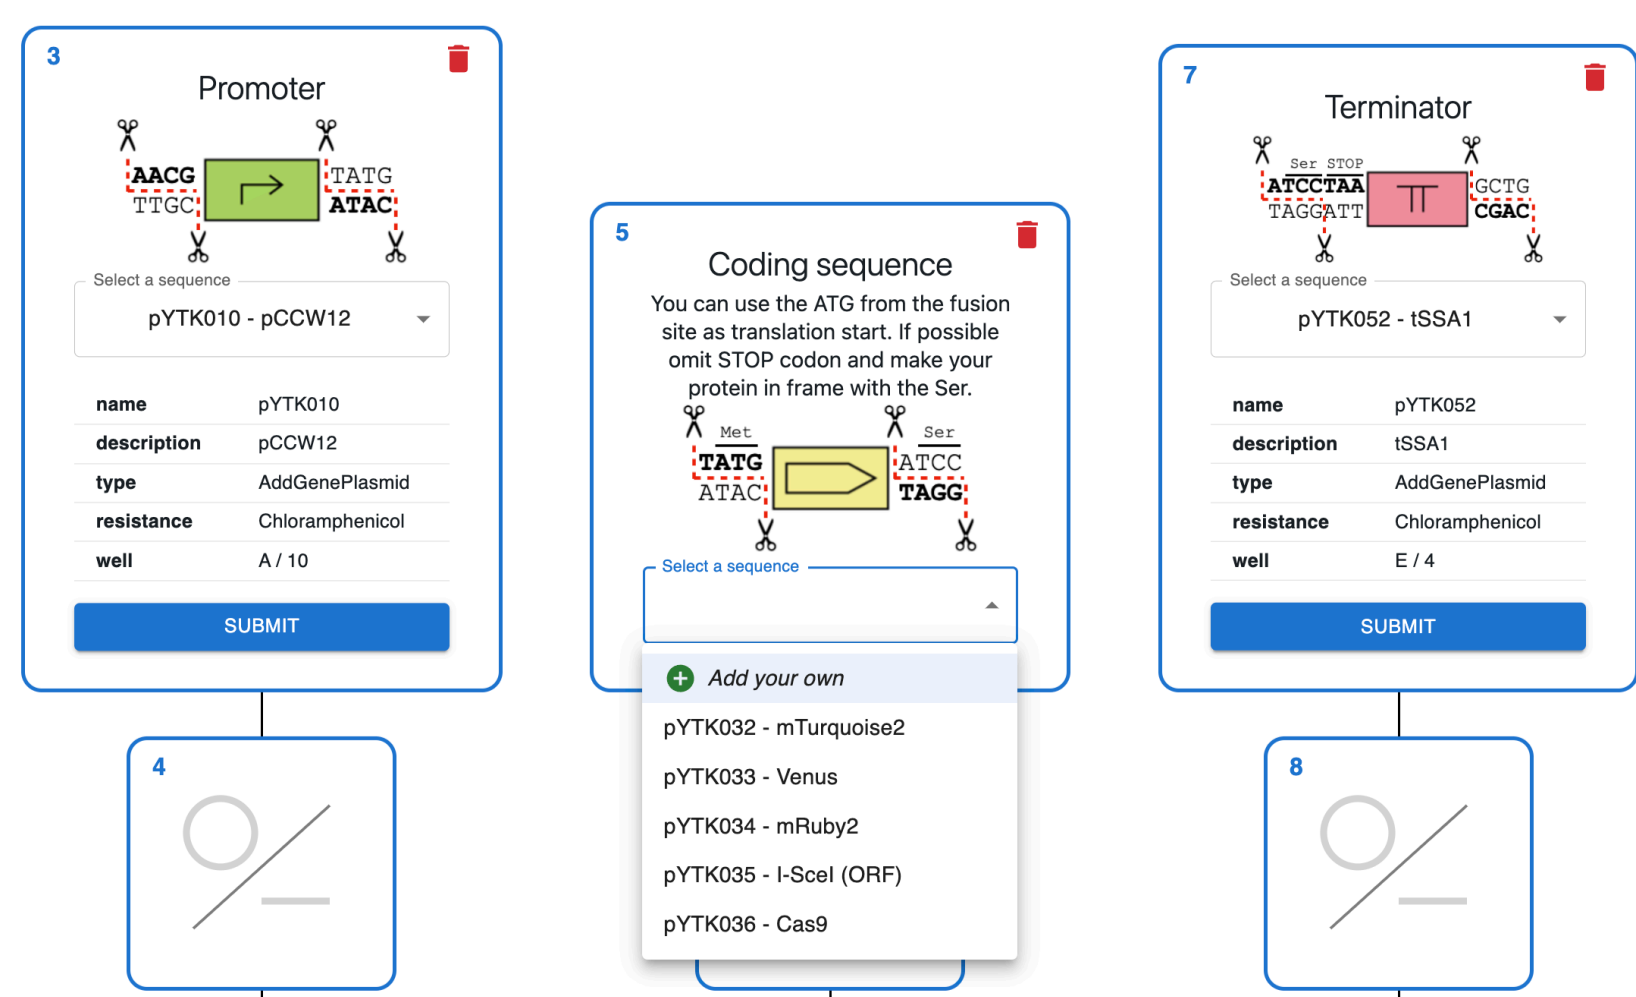

Primer design

- Gibson Assembly
- Hom. Recombination
- CRISPR-HDR
- Restriction - ligation
- Checking PCR

Cloning kit templates

It's very easy to create your own templates in Excel!

Coming soon

- Private sequence database for your lab
 - Ancestry and progeny of all resources.
 - Rich queries (e.g., alleles of a certain gene, plasmids with a given marker)
- Strain and cell line support
 - Genotypes as arrays of alleles.
 - Alleles as cloning strategies starting from wt locus.
- Better automation support
 - Generate the same output using a pydna script.
- Integration with e-lab notebooks
 - eLabFTW and LabID (EMBL).
- Attach supporting evidence
 - Gel images
 - Sequencing data (auto-aligned).
- One Click Export/Report/Share/Publish
 - Generate "Materials and Methods" text and files.
 - Generate publisher-specific tables (e.g., STAR).
 - Submit to repositories and generate unique IDs.
